Introduction

## The three functions

$$E(h,z) = \int_{-h}^h \frac{e^{-j\beta R}}{R} dz' = \int_0^{h/\lambda} \left\{ \frac{e^{-j2\pi\bar{R}_1}}{\bar{R}_1} + \frac{e^{-j2\pi\bar{R}_2}}{\bar{R}_2} \right\} dz'$$

$$C(h,z) = \int_{-h}^h \cos \beta z' \frac{e^{-j\beta R}}{R} dz' = \int_0^{h/\lambda} \cos 2\pi z' \left\{ \frac{e^{-j2\pi\bar{R}_1}}{\bar{R}_1} + \frac{e^{-j2\pi\bar{R}_2}}{\bar{R}_2} \right\} dz'$$

$$S(h,z) = \int_{-h}^h \sin \beta |z'| \frac{e^{-j\beta R}}{R} dz' = \int_0^{h/\lambda} \sin 2\pi z' \left\{ \frac{e^{-j2\pi\bar{R}_1}}{\bar{R}_1} + \frac{e^{-j2\pi\bar{R}_2}}{\bar{R}_2} \right\} dz'$$

have wide applications in the theory of linear antennas [1, 2]. In such applications the symbols have the following meanings:

$h$  = antenna half-length

$\beta = \frac{2\pi}{\lambda}$ ,  $\lambda$  = wavelength

$z$  = distance along the antenna

$$R = \sqrt{(z - z')^2 + b^2} , \quad b = \text{distance between the element center in an array of antennas}$$

$$R_1 = \sqrt{(z/\lambda - z'_1)^2 + (b/\lambda)^2} \\ b = a, \text{ the antenna radius, for single antennas}$$

$$R_2 = \sqrt{(z/\lambda + z'_1)^2 + (b/\lambda)^2}$$

Although these functions can be expressed in terms of the generalized sine and cosine integrals which are tabulated [3], the calculations required for numerical evaluations are very tedious. The object of the present table is to tabulate  $E(h,z)$ ,  $C(h,z)$ , and  $S(h,z)$  directly for a useful but not exhaustive set of parameters and with sufficient accuracy for most applications. The table was calculated at The Computation Center, Massachusetts Institute of Technology, on an International Business Machine 704 computer, and was principally the byproduct of the computation of impedances and current distributions of circular antenna arrays.

#### Arrangement of Tables

Values of the integrals applicable to a single antenna are given in the first six pages of the table for six different antenna radii,  $a/\lambda$ . Each value of  $a/\lambda$  corresponds to  $\Omega = 10$  for one of the six  $h/\lambda$ 's, where

$$\Omega = 2 \ln \frac{2h}{a}$$

For each value of  $a/\lambda$  the integrals are tabulated at constant  $a/\lambda$  for all six values of  $h/\lambda$ . The complete set of  $\Omega$ 's corresponding to the various combinations of  $a/\lambda$  and  $h/\lambda$  is given in the Table of  $\Omega$ .

Throughout the table the integrals have been computed for  $h/\lambda$  ranging from  $1/8$  to  $3/4$  in steps of  $1/8$ , or  $\beta h = \frac{\pi}{4} (\frac{\pi}{4}) \frac{3\pi}{2}$ . For each  $h/\lambda$ , the range of  $z/\lambda$  is from 0 to  $h/\lambda$  in steps of  $\frac{1}{16}$ , or  $\beta z = 0(\pi/8)\beta h$ . The values of  $b/\lambda$  go from  $1/8$  to 5 in steps of  $1/16$ , and from 5 to 10 in steps of  $1/8$ ,  $\beta b = \frac{\pi}{4} (\frac{\pi}{8}) 5, 5(\frac{\pi}{4}) 10$ .

Calculation Procedure and Accuracy

For computational purposes the integrals were written in the second form above. The kernels were separated into their real and imaginary parts, evaluated directly for an appropriate number of  $z'$ 's; and integrated numerically by the use of Simpson's Rule. In this instance an odd number of evenly spaced points were chosen, so Simpson's Rule as applied here may be stated as follows:

$$\text{Let } I = \int_r^s f(y) dy$$

$N + 1$  = number of points at which the integrand is evaluated

$h$  = internal size

then

$$I \approx \frac{h}{3} \left\{ y_r + y_s + 4(y_{r+1} + y_{r+3} + \dots + y_{s-1}) + 2(y_{r+2} + y_{r+4} + \dots + y_{s-2}) \right\}$$

The interval sizes in this table were selected to give five decimal place accuracy for  $5.053461 \times 10^{-3} \leq b/\lambda \leq 10.0$ . The interval size used for  $b/\lambda = 3.368974 \times 10^{-3}$  yielded an accuracy of  $\pm .00002$ , and that used for  $b/\lambda = 1.684487 \times 10^{-3}$  yielded an accuracy of  $\pm .0002$ . In the two smallest  $b/\lambda$ 's, accuracy was sacrificed to keep the required computer time to a reasonable amount. The actual interval sizes used are listed below.

$\Delta z'$	range of $b/\lambda$
$.32552083 \times 10^{-3}$	$1.684487 \times 10^{-3} \leq b/\lambda \leq 1.684487 \times 10^{-3}$
$.65104166 \times 10^{-3}$	$3.368974 \times 10^{-3} \leq b/\lambda \leq 5.053461 \times 10^{-3}$
$1.3020833 \times 10^{-3}$	$6.737947 \times 10^{-3} \leq b/\lambda \leq .010106921$
.015625	$.125 \leq b/\lambda \leq 10.0$

The error was determined by obtaining the integrals at the given interval size and at double the given interval sizes and comparing results. (If  $I_1$  = result obtained using the given interval size and  $I_2$  = result obtained using double the given interval size [4] ,

$$\epsilon \approx \frac{I_2 - I_1}{15} . . . )$$

$a/\lambda$	$1.684487 \times 10^{-3}$	$3.368974 \times 10^{-3}$	$5.053461 \times 10^{-3}$	$6.737947 \times 10^{-3}$	$8.422434 \times 10^{-3}$	$10.106921 \times 10^{-3}$
